Syntax of LTL

Given AP, a set of propositions,

- Propositional logic formulae over AP
 - ▶ $a \in AP$ (atomic propositions)
 - $\triangleright \neg \varphi, \varphi \land \psi, \varphi \lor \psi$
- Temporal Operators
 - $\triangleright \bigcirc \varphi \text{ (Next } \varphi)$
 - $\varphi \ \mathsf{U} \psi \ (\varphi \ \mathsf{holds} \ \mathsf{until} \ \mathsf{a} \ \psi\mathsf{-state} \ \mathsf{is} \ \mathsf{reached})$

$$\varphi ::= \mathbf{a} \mid \varphi \lor \varphi \mid \neg \varphi \mid \varphi \land \varphi \mid \bigcirc \varphi \mid \varphi \mathsf{U} \varphi$$

Given LTL formula φ over AP,

$$L(\varphi) = \{ \sigma \in (2^{AP})^{\omega} \mid \sigma \models \varphi \}$$

Given LTL formula φ over AP,

$$L(\varphi) = \{ \sigma \in (2^{AP})^{\omega} \mid \sigma \models \varphi \}$$

Let $\sigma = A_0 A_1 A_2 \dots$

▶ $\sigma \models a \text{ iff } a \in A_0$

Given LTL formula φ over AP,

$$L(\varphi) = \{ \sigma \in (2^{AP})^{\omega} \mid \sigma \models \varphi \}$$

- $ightharpoonup \sigma \models a \text{ iff } a \in A_0$
- \bullet $\sigma \models \varphi_1 \land \varphi_2 \text{ iff } \sigma \models \varphi_1 \text{ and } \sigma \models \varphi_2$

Given LTL formula φ over AP,

$$L(\varphi) = \{ \sigma \in (2^{AP})^{\omega} \mid \sigma \models \varphi \}$$

- $ightharpoonup \sigma \models a \text{ iff } a \in A_0$
- \bullet $\sigma \models \varphi_1 \land \varphi_2$ iff $\sigma \models \varphi_1$ and $\sigma \models \varphi_2$

Given LTL formula φ over AP,

$$L(\varphi) = \{ \sigma \in (2^{AP})^{\omega} \mid \sigma \models \varphi \}$$

- $ightharpoonup \sigma \models a \text{ iff } a \in A_0$
- \bullet $\sigma \models \varphi_1 \land \varphi_2$ iff $\sigma \models \varphi_1$ and $\sigma \models \varphi_2$
- $\triangleright \ \sigma \models \bigcirc \varphi \text{ iff } A_1 A_2 \ldots \models \varphi$

Given LTL formula φ over AP,

$$L(\varphi) = \{ \sigma \in (2^{AP})^{\omega} \mid \sigma \models \varphi \}$$

- $ightharpoonup \sigma \models a \text{ iff } a \in A_0$
- \bullet $\sigma \models \varphi_1 \land \varphi_2 \text{ iff } \sigma \models \varphi_1 \text{ and } \sigma \models \varphi_2$
- $\triangleright \ \sigma \models \bigcirc \varphi \text{ iff } A_1 A_2 \ldots \models \varphi$
- ▶ $\sigma \models \varphi \cup \psi$ iff $\exists j \geqslant 0$ such that $A_i A_{i+1} \dots \models \psi \land \forall 0 \leqslant i < j, A_i A_{i+1} \dots \models \varphi$

Given LTL formula φ over AP,

$$L(\varphi) = \{ \sigma \in (2^{AP})^{\omega} \mid \sigma \models \varphi \}$$

Given LTL formula φ over AP,

$$L(\varphi) = \{ \sigma \in (2^{AP})^{\omega} \mid \sigma \models \varphi \}$$

Given LTL formula φ over AP,

$$L(\varphi) = \{ \sigma \in (2^{AP})^{\omega} \mid \sigma \models \varphi \}$$

- $ightharpoonup \sigma \models \Box \varphi \text{ iff } \forall j \geqslant 0, A_i A_{i+1} \ldots \models \varphi$

Given LTL formula φ over AP,

$$L(\varphi) = \{ \sigma \in (2^{AP})^{\omega} \mid \sigma \models \varphi \}$$

Given LTL formula φ over AP,

$$L(\varphi) = \{ \sigma \in (2^{AP})^{\omega} \mid \sigma \models \varphi \}$$

- $ightharpoonup \sigma \models \Box \varphi \text{ iff } \forall j \geqslant 0, A_i A_{i+1} \ldots \models \varphi$

If $\sigma = A_0 A_1 A_2 \ldots$, $\sigma \models \varphi$ is also written as $\sigma, 0 \models \varphi$. This simply means $A_0 A_1 A_2 \ldots \models \varphi$. One can also define $\sigma, i \models \varphi$ to mean $A_i A_{i+1} A_{i+2} \ldots \models \varphi$ to talk about a suffix of the word σ satisfying a property.

Let $TS = (S, S_0, \rightarrow, AP, L)$ be a transition system, and φ an LTL formula over AP

▶ For an infinite path π of TS,

$$\pi \models \varphi \text{ iff } trace(\pi) \models \varphi$$

Let $TS = (S, S_0, \rightarrow, AP, L)$ be a transition system, and φ an LTL formula over AP

▶ For an infinite path π of TS,

$$\pi \models \varphi \text{ iff } trace(\pi) \models \varphi$$

▶ For $s \in S$,

$$s \models \varphi \text{ iff } \forall \pi \in \textit{Paths}(s), \pi \models \varphi$$

Let $TS = (S, S_0, \rightarrow, AP, L)$ be a transition system, and φ an LTL formula over AP

▶ For an infinite path π of TS,

$$\pi \models \varphi \text{ iff } trace(\pi) \models \varphi$$

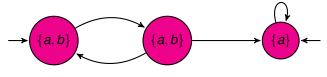

► For $s \in S$, $s \vdash \varphi$ iff $\forall \pi \in Paths(s)$

$$s \models \varphi \text{ iff } \forall \pi \in \textit{Paths}(s), \pi \models \varphi$$

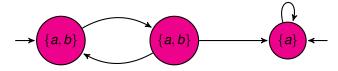

▶ $TS \models \varphi \text{ iff } Traces(TS) \subseteq L(\varphi)$

Assume all states in TS are reachable from S_0 .

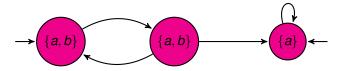

- ► $TS \models \varphi \text{ iff } \pi \models \varphi \ \forall \pi \in Paths(TS)$
- $\blacktriangleright \pi \models \varphi \ \forall \pi \in Paths(TS) \ \text{iff} \ s_0 \models \varphi \ \forall s_0 \in S_0$

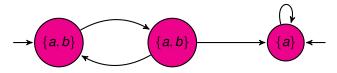

TS |= □a,

- *► TS* |= □*a*,
- ▶ $TS \nvDash \bigcirc (a \land b)$

- TS |= □a,
- ▶ $TS \nvDash \bigcirc (a \land b)$
- ► $TS \nvDash (b \cup (a \land \neg b))$

- TS |= □a,
- ▶ $TS \nvDash \bigcirc (a \land b)$
- ► $TS \nvDash (b \cup (a \land \neg b))$
- $TS \models \Box (\neg b \rightarrow \Box (a \land \neg b))$

More Semantics

▶ For paths π , $\pi \models \varphi$ iff $\pi \nvDash \neg \varphi$

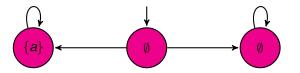

More Semantics

- ► For paths π , $\pi \models \varphi$ iff $\pi \nvDash \neg \varphi$ trace(π) $\in L(\varphi)$ iff trace(π) $\notin L(\neg \varphi) = \overline{L(\varphi)}$
- ▶ $TS \nvDash \varphi$ iff $TS \models \neg \varphi$?
 - ► $TS \models \neg \varphi \rightarrow \forall$ paths π of TS, $\pi \models \neg \varphi$
 - ▶ Thus, $\forall \pi, \pi \nvDash \varphi$. Hence, $TS \nvDash \varphi$

More Semantics

- ► For paths π , $\pi \models \varphi$ iff $\pi \nvDash \neg \varphi$ trace(π) $\in L(\varphi)$ iff trace(π) $\notin L(\neg \varphi) = \overline{L(\varphi)}$
- ▶ $TS \nvDash \varphi$ iff $TS \models \neg \varphi$?
 - ► $TS \models \neg \varphi \rightarrow \forall$ paths π of TS, $\pi \models \neg \varphi$
 - ▶ Thus, $\forall \pi, \pi \nvDash \varphi$. Hence, $TS \nvDash \varphi$
 - ▶ Now assume $TS \nvDash \varphi$
 - ▶ Then \exists some path π in TS such that $\pi \models \neg \varphi$
 - ▶ However, there could be another path π' such that $\pi' \models \varphi$
 - ▶ Then $TS \nvDash \neg \varphi$ as well
- ▶ Thus, $TS \nvDash \varphi \not\equiv TS \models \neg \varphi$.

An Example

 $TS \nvDash \Diamond a$ and $TS \nvDash \Box \neg a$

Equivalence

 φ and ψ are equivalent $(\varphi \equiv \psi)$ iff $L(\varphi) = L(\psi)$.

Expansion Laws

 φ and ψ are equivalent iff $L(\varphi) = L(\psi)$.

 φ and ψ are equivalent iff $L(\varphi) = L(\psi)$.

Distribution

$$\bigcirc(\varphi \vee \psi) \equiv \bigcirc\varphi \vee \bigcirc\psi,$$

 φ and ψ are equivalent iff $L(\varphi) = L(\psi)$.

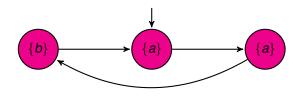

Distribution

$$\bigcirc(\varphi \lor \psi) \equiv \bigcirc\varphi \lor \bigcirc\psi,
\bigcirc(\varphi \land \psi) \equiv \bigcirc\varphi \land \bigcirc\psi,
\bigcirc(\varphi U\psi) \equiv (\bigcirc\varphi) U(\bigcirc\psi),$$

 φ and ψ are equivalent iff $L(\varphi) = L(\psi)$.

Distribution

$$\bigcirc(\varphi \lor \psi) \equiv \bigcirc\varphi \lor \bigcirc\psi,
\bigcirc(\varphi \land \psi) \equiv \bigcirc\varphi \land \bigcirc\psi,
\bigcirc(\varphi U\psi) \equiv (\bigcirc\varphi) U(\bigcirc\psi),
\diamondsuit(\varphi \lor \psi) \equiv \diamondsuit\varphi \lor \diamondsuit\psi,
\Box(\varphi \land \psi) \equiv \Box\varphi \land \Box\psi$$

$$TS \models \Diamond a \land \Diamond b, TS \nvDash \Diamond (a \land b)$$

$$TS \models \Box (a \lor b), TS \nvDash \Box a \lor \Box b$$

Satisfiability, Model Checking LTL

Two Questions

- 1. Given transition system *TS*, and an LTL formula φ . Does $TS \models \varphi$?
- 2. Given an LTL formula φ , is $L(\varphi) = \emptyset$?

Satisfiability, Model Checking LTL

Two Questions

- 1. Given transition system *TS*, and an LTL formula φ . Does $\mathit{TS} \models \varphi$?
- 2. Given an LTL formula φ , is $L(\varphi) = \emptyset$?

How we go about this:

▶ Translate φ into an automaton A_{φ} that accepts infinite words such that $L(A_{\varphi}) = L(\varphi)$. Check (somehow) for emptiness of A_{φ} to check satisfiability of φ .

Satisfiability, Model Checking LTL

Two Questions

- 1. Given transition system *TS*, and an LTL formula φ . Does $\mathit{TS} \models \varphi$?
- 2. Given an LTL formula φ , is $L(\varphi) = \emptyset$?

How we go about this:

- ▶ Translate φ into an automaton A_{φ} that accepts infinite words such that $L(A_{\varphi}) = L(\varphi)$. Check (somehow) for emptiness of A_{φ} to check satisfiability of φ .
- ▶ Check (somehow) $TS \cap \overline{A_{\varphi}}$ is empty, to answer the model-checking problem.

Notations for Infinite Words

- Σ is a finite alphabet
- Σ* set of finite words over Σ
- \triangleright Σ^{ω} set of infinite words over Σ
- ▶ An infinite word is written as $\alpha = \alpha(0)\alpha(1)\alpha(2)\dots$, where $\alpha(i) \in \Sigma$
- Such words are called ω-words
- ▶ $Inf(\alpha) = \{a \in \Sigma \mid \alpha(i) = a \text{ for infinitely many } i\}$. $Inf(\alpha)$ gives the set of symbols occurring infinitely often in α .

ω -automata $\bigcup_{\mathcal{M}} \cdot q_{\mathcal{M}}$

An ω -automaton is a tuple $\mathcal{A} = (Q, \Sigma, \delta, q_0, Acc)$ where

- Q is a finite set of states
- Σ is a finite alphabet
- ▶ $\delta: Q \times \Sigma \to 2^Q$ is a state transition function (if non-deterministic, otherwise, $\delta: Q \times \Sigma \to Q$)
- $q_0 \in Q$ is an initial state and Acc is an acceptance condition

ω -automata

An ω -automaton is a tuple $\mathcal{A} = (Q, \Sigma, \delta, q_0, Acc)$ where

- Q is a finite set of states
- Σ is a finite alphabet
- ▶ $\delta: Q \times \Sigma \to 2^Q$ is a state transition function (if non-deterministic, otherwise, $\delta: Q \times \Sigma \to Q$)
- ▶ $q_0 \in Q$ is an initial state and Acc is an acceptance condition

Run

A run ρ of \mathcal{A} on an ω -word $\alpha = a_1 a_2 \cdots \in \Sigma^{\omega}$ is an infinite state sequence $\rho(0)\rho(1)\rho(2)\ldots$ such that

- $\rho(i) = \delta(\rho(i-1), a_i)$ if A is deterministic,
- $\rho(i) \in \delta(\rho(i-1), a_i)$ if A is non-deterministic,

ω -automata

An ω -automaton is a tuple $\mathcal{A} = (Q, \Sigma, \delta, q_0, Acc)$ where

- Q is a finite set of states
- Σ is a finite alphabet
- ▶ $\delta: Q \times \Sigma \to 2^Q$ is a state transition function (if non-deterministic, otherwise, $\delta: Q \times \Sigma \to Q$)
- ▶ $q_0 \in Q$ is an initial state and Acc is an acceptance condition

Run

A run ρ of $\mathcal A$ on an ω -word $\alpha=a_1a_2\cdots\in \Sigma^\omega$ is an infinite state sequence $\rho(0)\rho(1)\rho(2)\ldots$ such that

- ▶ $\rho(0) = q_0$,
- $\rho(i) = \delta(\rho(i-1), a_i)$ if A is deterministic,
- ▶ $\rho(i) \in \delta(\rho(i-1), a_i)$ if A is non-deterministic,

Büchi Acceptance

For Büchi Acceptance, Acc is specified as a set of states $G \subseteq Q$ The ω -word α is accepted if there is a run ρ of α such that $Inf(\rho) \cap G \neq \emptyset$.

Comparing NFA and NBA

(Non)deterministic Büchi Automata

$$L(A) = \{ \alpha \in \Sigma^{\omega} \mid \alpha \text{ has a run } \rho \text{ such that } \mathit{Inf}(\rho) \cap G \neq \emptyset \}$$

(Non)deterministic Finite Automata

$$L(A) = \{ \alpha \in \Sigma^* \mid \alpha \text{ has a run } \rho \text{ ending in some final state } \}$$

Comparing NFA and NBA

(Non)deterministic Büchi Automata

$$L(A) = \{ \alpha \in \Sigma^{\omega} \mid \alpha \text{ has a run } \rho \text{ such that } Inf(\rho) \cap G \neq \emptyset \}$$

(Non)deterministic Finite Automata

$$L(A) = \{ \alpha \in \Sigma^* \mid \alpha \text{ has a run } \rho \text{ ending in some final state } \}$$

Comparing NFA and NBA

(Non)deterministic Büchi Automata

 $L(A) = \{ \alpha \in \Sigma^{\omega} \mid \alpha \text{ has a run } \rho \text{ such that } Inf(\rho) \cap G \neq \emptyset \}$

(Non)deterministic Finite Automata

 $L(A) = \{ \alpha \in \Sigma^* \mid \alpha \text{ has a run } \rho \text{ ending in some final state } \}$

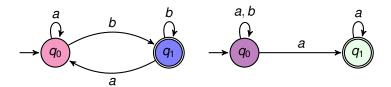

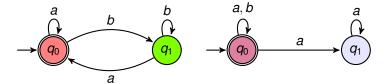

ω -Automata with Büchi Acceptance

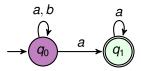

- ▶ Left (T-B): Inf many b's, Inf many a's
- ▶ Right (T-B): Finitely many b's, $(a + b)^{\omega}$

Büchi Acceptance

A language $L\subseteq \Sigma^\omega$ is called ω -regular if there exists a NBA $\mathcal A$ such that $L=L(\mathcal A)$. Recall definition of regular languages and NFA/DFA acceptance.

NBA and **DBA**

- ▶ Is every DBA as expressible as a NBA, like in the case of DFA and NFA?
- Can we do subset construction on NBA and obtain DBA?

NBA and **DBA**

- Is every DBA as expressible as a NBA, like in the case of DFA and NFA?
- ▶ Can we do subset construction on NBA and obtain DBA?
